'Identification and immunocytochemical localization of proctolin in pericardial organs of the shore crab, Carcinus maenas.";

Peptides 7:67-72(1986),

1- FUNCTION: STINULATES CARDIAC OUTPUT AND HINDGUT MOTILITY,
MODULATES VISCERAL AND SKELETAL MUSCLE IN MANY ARTHROPODS.

1- TISSUE SPECIFICITY: FOUND IN THE LATERAL WHITE NEURONS AND IN THE CRAB PERICARDIAL ORGANS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAY69576-Y69586 and AAY69598-Y69599 represent peptides that may CC be used to induce anti-IgE (immunoglobulin E) autoantibodies in a dog. CG IgE is an important mediator of canine allergic responses, including Type CC I immediate hypersensitivity. It is estimated that up to 30% of all dogs CG suffer from allergies or allergy-related skin disorders, and allergic CC dermatitis is thought to affect between 3 and 15% of dogs. Common canine CC allergens include fleas, pollens, moulds and dust, with flea allergy being the most frequent. Once IgE has been released in response to being the most frequent. Once IgE has been released in response to can then become cross-linked, which induces the mast cells to release CC histamine, which leads to the manifestation of allergic symptoms. The peptides of the invention correspond to epitopes of canine IgE, or conservative variations thereof; that are accessible in circulating IgE out not in IgE bound to mast cells. The autoantibodies produced on the mould exacerbate an ongoing allergic response even in the absence CC which would exacerbate an ongoing allergic response even in the absence CC symptoms that targets the IgE-expressing B cell, which affects IgE con the IgE-producing B cell for destruction. The peptides of the invention CC are therefore useful for destruction by B cells and/or targetting CC symptoms in a dog.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a comprising a therapeutically active amino acid region (III) and a comprising at herapeutically active amino acid region (III) and a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Composed the action of peptidases to increase length of activity (half intracellular uptake and interference with physiological processes. ximum DB
         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

 The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a method of antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject: (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA) reactive fragment, to form a complex of the histone H1-like antigen, or the pANCA-reactive fragment, and antibody to the histone H1-like antigen; and (3) detecting the presence or absence of the complex; where the presence of the complex; where the presence of the complex indicates that the subject has UC. The paNCA-reactive histone H1-like antigen, porin antigen and Bacteroides antigen are useful in the diagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. Sequences AAY34072-87 complex indicates that the subject has UC. The methods can also be used for identifying agents useful for treating UC. Sequences AAY34072-87 complex indicates the protection of the B. caccae 100 kDa antigen (a microbial pANCA-reactive protein).

 bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a complex of the histone H1-like antigen, or the pANCA-reactive fragment, to form the presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone H1-like antigen, portinantigen and sectoraldes antigen are useful in the diagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. Sequences ANY34072-87 represent peptides derived from the B. caccae 100 kpa antigen (a microbial panCA-reactive protein).
The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone HI-like antigen, a poin antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBB) comperises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone HI-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a complex of the histone HI-like antigen, or the pANCA-reactive fragment, and antibody to the histone HI-like antigen; and (3) detecting the presence or absence of the complex indicates that the subject has UC. The pANCA-reactive histone HI-like antigen, porin antigen and Bacteroides antigen are useful in the

 OM protein - protein search, using sw model
 inimum DB seq length: 0 waximum DB seq length: 8
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
